

2018 Annual Average Mean Results for Nitrogen Dioxide in Wirral

*Applies to places where people are exposed for the relevant time

It is important to note that not all monitoring sites are located at sites of relevant exposure. In particular site W18 is not classified as a site of relevant exposure for the average annual mean result. Therefore, although a result above $40\mu\text{g}/\text{m}^3$ was recorded, it does not breach the annual air quality objective.
